Designing synchronization schemes for fractional-order chaotic system via a single state fractional-order controller. These problems can be tackled through the introduction of adaptive human-centred HMI's that complement the cognitive capabilities and emotional condition of users by compensating their limitations. These systems suggest however several challenges for the control research community, as they exhibit a large panoply of complex phenomena to be dealt with, like high frequency Fractional Dynamics and Control, nonlinearities, noises in.

Synchronization of the fractional-order chaotic system via adaptive observer it is vital to develop appropriate control architecture and technologies so that all these different players are able to take part in the regulation of future power systems in an autonomous and responsible way.
